

ARGENTEX

Precious metal recovery, starting with end-of-life solar.

June 2026

ABOUT ARGENTEX

Argentex is a specialist precious metal recovery operation. We recover precious metals from solar panel back-sheets and other metal-bearing electronic waste, refine them to investment grade, and return the recovered value to the regional economy as bullion. Solar is where this begins.

THE OPPORTUNITY

I. A value stream that leaves the region

Solar is where this begins. South Africa installed an estimated 11 gigawatts of capacity through the energy-supply crisis of recent years, and solar build-out continues across the region. Those panels carry a finite life. As they reach the end of it, the glass, the aluminium frames and the junction boxes are already recovered by licensed recyclers.

The back-sheet, which holds the precious metal, is not. The same gap runs through other electronic waste streams that still carry recoverable metal. Today this material is stockpiled, sent to landfill, or exported for processing abroad, and its value leaves with it. Argentex exists to close that gap.

WHAT WE DO

II. Controlled recovery, investment-grade metal

We take back-sheet material and metal-bearing e-waste from licensed recyclers and recover the precious metals through a controlled refining process. The back-sheet is reduced by pyrolysis to an ash, from which silver, lead, tin and copper are recovered hydrometallurgically; copper wire is recovered separately. Each metal is refined to investment grade and sold into the bullion and commodity markets.

We carry the processing, the equipment and the operational risk, so our supply partners turn a stockpiled waste stream into recurring value without carrying any of the cost.

Silver, gold and copper, recovered and refined to investment grade.

HOW WE WORK WITH RECYCLERS

III. Alongside the industry, not against it

Argentex is built to work alongside the existing recycling industry, not against it. Licensed recyclers already do the heavy work of collection and primary separation. We add the step the market is missing: commercial precious metal recovery.

We take the whole stream, including the fractions other buyers leave behind. Fluorinated compounds are captured in the emissions scrubbers and lead is fully recovered rather than dispersed. The residual ash is washed and laboratory-tested to confirm it falls within the limits permitted for landfill.

Every batch carries its own mass balance, test certificates and waste-audit trail, returned to the recycler so the obligation is met on both sides. Material flows to us and value flows back: the recycler hands over a stockpiled liability and keeps neither the material nor the risk.

RESPONSIBILITY

IV. Value retained in the material

Recovering precious metals close to source retains the value held in the material rather than exporting it for others to capture, and it keeps end-of-life panels and e-waste out of landfill and out of export containers.

We operate to the environmental and licensing standards the work demands, with traceability from the input material through to the refined metal and the residue that leaves the process.

ARGENTEX

Commercial precious metal recovery for the region, built by people who know its solar, e-waste and refining industries.

COMPANY

V. The team

Argentex brings together commercial, operational and technical experience drawn from the region's solar, e-waste and refining industries.
